Two methods were developed for the direct determina-  
tion of the adhesion of polymeric binders to glass fila-  
ments. The methods are based on measurement of dis-  
placement force of glass filament with respect to the  
film of polymerized binder and on determination of the  
contact area between the resin and filament. One of the

DESCRIPTORS: \*Threads. Tensile properties

Each construction of the disk-like thread-tensioning device has, for a given type of thread, a certain velocity limit  $v_0$  of the thread passing through the device. If the thread moves through the tensioning device with a velocity higher than  $v_0$ , it causes a rapid increase in the breakage frequency, whereby the thread breaks probably in places where it is not technologically necessary. By reducing the mass of those parts of the tensioning device, which are driven by the thread, it is possible to improve considerably the performance of the device and (Materials). The behavior of the various sorts of bricks is evaluated on the basis of microscopic tests as to appearance, vitrification, changes in volume as well as of microscopic comparisons of the original samples with the samples changed (Materials--Refractories, TT, v. 10, no. 3) (over)</p> | <p>63-14352</p> <p>I.
